Effects of Three Growth Regulators Induced Flowering on Yield and Quality of Ripley Queen Pineapple (Ananas comosus) in Fiji.

23/10/17

ISTF, TANOA HOTEL, NADI, FIJI.

Manoa Iranacolaivalu,

Horticulture Research, Research Division,

Ministry of Agriculture, Fiji Islands.

OUTLINE

- 1. INTRODUCTION
- 2. LITERATURE BACKGROUND
- 3. METHODOLOGY
- 4. RESULTS AND DISCUSSION
- 5. RECOMMENDATION AND CONCLUSION

INTRODUCTION

HISTORY

1920s

- Pineapple was an industry in Fiji dated back to the 1920s through the Colonial Sugar Refinery (CSR).
- Other big players at the time were the Hawaiian Pineapple Company and West Coast Pines Ltd who set up cannery at Dreketi, Macuata and at Votualevu, Nadi respectively.

1990

• Early 1990s - another attempt to revive this ancient industry. EU funded the project on fresh export to NZ.

Todate

- Lately, the Pineapple Export pathway was developed through the Pacific Horticultural and Agricultural Market Access Project for the fresh export market to New Zealand with suppliers such as Turners and Growers.
- Agricultural Census (2009), 915 farmers producing 2,800 tonnes of pineapples annually under 1,100 acres. Pineapples are overwhelmingly sold on the local fresh fruit market for a value to farmers of about \$2.4 million.
- There is huge demand locally compared to overseas market, resulted in NO export for the past 2-3 years.
- Furthermore, The Fruit processing company (AGRANA Fruits Ltd) is also processing pineapple juice.

INTRODUCTION

- PINEAPPLE CONTRIBUTION: CANNOT BE OVEREMPHASISED
 - Food and nutrition security
 - Income security
 - Contribution to Climate Change Combat Strategies SLM, Drought tolerance crop, Cropping system, etc.
- Big Challenge The market pull coupled with the seasonality of the crop.
- Solution: To produce the fruit all year round using Growth Regulators (GR).
- GR Availability Currently, we have 3 Brand name of GR (Ethephon (48% 2-chloroethylphosphonic acid), Floraset (4% 1-naphthalene acetic acid) and EPGR 108 (10.8% 2-chloroethylphosphonic acid) in the market.

Research

- Ripley queen variety is the widely cultivated pineapple variety in Fiji.
- The research aims to evaluate the efficacy of these 3 Growth Regulator chemicals in the production of "Ripley Queen" pineapple and recommend the most efficient and affordable GR.
- The experiment was carried out at Seaqaqa Research Station in Vanua levu.

LITERATURE REVIEW

1. Ethephon (48% 2-chloroethylphosphonic acid)

Ethylene, a gaseous plant hormone, is responsible for the initiation of reproductive development in pineapple. Reproductive development can be forced in pineapple (Ananas comosus var. comosus) throughout the year with ethylene (Maruthasalam, et. al, 2009).

Van Santen 2017 states that **2 Chloroethylphosphonic acids or Etyphon**, available as "Ethrel", "Ethephon", or "EPGR 10". This is a world-wide used chemical for the harvest control in pineapple.

This chemical is used in combination with Urea-, and in some cases Boron -fertilizer. It is thought to have a positive effect on the success of flower initiation, especially where a deficiency of this micro nutrient (B) can be expected and pH of mixture is rather low. This chemical and the fertilizers are mixed in water and sprayed in the direction of the heart the plants at a rate of approx. 35 to 50 ml per plant. Spray is preferably done in the afternoon, when the day cools off and the dark evening effect will follow.

LITERATURE REVIEW

2. Alpha-Naphtaline Acetic Acid or ANA

- Available direct under the name a.n.a or under a range of trade names eg. Floraset (4% 1-naphthalene acetic acid) (recommended as rooting media as well as flowering hormone. However this chemical is an auxin and is less effective in flower induction than the above mentioned ethephon, with fruiting rates varying over an unacceptable range between 30% to 70% effectiveness, which is too low and unreliable for commercial production. It will be better effective in the higher latitudes and used towards the shorter day periods. As a rooting hormone this chemical can be useful, and in the climates with distinct short days in the seasonal periods of the year it might work a bit more effective in the short-day periods just before the natural season (Van Santen, 2017).
- Danso et. Al, 2008, states that NAA is used in invitro production of pineapple plantlets. The transfer of one or two-month old cultured plantlets to solid MS medium supplemented with NAA or IBA alone or combination of NAA and IBA resulted in root production. The number of root produced per plantlet on a medium supplemented with a combination of NAA and IBA was comparably higher than when NAA or IBA alone were used.

METHODOLOGY

| | ACTIVITIES | TIME |
|----|------------------|--|
| 1 | SOIL | pH – 5.6; EC – 0.06; N% - 0.2; Olsen P – 1.0mg/kg; K - 0.20 me/100g |
| 2 | WEATHER | Temp – 18.9 - 29.1; Rainfall - 17.5mm; Rainfall days – 4; Humidity - 71 |
| 3 | CROP | Pineapple – "Ripley queen" (Planting material – Plantlets (350 - 400g) |
| 4 | DESIGN | RCBD (FACTORIAL) |
| 5 | TREATMENTS | GR – 3 WITH 4 LEVELS (Ethphon & Floraset - 5ml/; 10ml; 15ml/10L/water); EPGR108 (30ml, 35ml, 40ml/10L water) Mixture – Chemical + 10g Borax + 50g Urea + 10L water; 50ml/plant |
| 6 | REPLICATION | 3 |
| 7 | DATE OF PLANTING | JUNE 2014 |
| 8 | MAINTENANCE | BASAL – Mill Mud 5tonnes/ha, Super phosphate: 250kg. SIDE DRESS: Urea: 110kg/ha at 1 month after planting. NPK: 13:13:21 at 250kg/ha at 4 months interval after planting. Weed Control: As and When required |
| 9 | GR APPLICATION | JUNE 2015 when D-leaf (Longest leaf) is 90-100cm; at 5-6pm |
| 10 | DATA VARIABLES | Date of fruit initiation; Date of harvest; Total fruit weight (Fruit & crown weight); Total Fruit length (Fruit & crown), Circumference; Brix using Refractometer. |
| 11 | HARVESTING | When the fruit is 85-90% ripeness |
| | | |

| SE(N= | 9) | | 0.238306 |
| 5%LSD | 28DI | <u>.</u> | 0.690320 |

THE TREATMENTS DO NOT HAVE ANY EFFECT ON THE SWEETNESS ON THE PINEAPPLE FRUIT.

RECOMMENDATION & CONCLUSION

- 1. Results have proved that the 3 GRs induces flowering and better yield in RQ variety.
- 2. EPGR108 and Ethephon produces promising results in terms of no. days taken from GR application to harvest.
- 3. Floraset (a rooting GR) proved to produce good results in terms of flower induction and yield.
- 4. Prospectus:
 - 1. Experiment to include the other two varieties, Smooth cayenne and Veimama.
 - 2. Evaluation of the GRs on ratoon crops (1 & 2)
 - 3. Experiment to incorporate with monthly planting of pineapple to determine the most appropriate period (month) for off-season production.
 - 4. GRs to be tested on alluvial soil type and in intermediate climatic zone.
 - 5. Experiment to further into post-harvest shelf life & fruit quality
 - 6. Need to conduct residual test on the MRL of the chemical
 - 7. Conduct economic analysis of the treatments based on the production life of the crop.

VINAKA VAKALEVU

THANK YOU
